|----------------------|-----------------------------------------------------------------------------------|
| <b>Date</b>          | 27 September 2026                                                                 |
| <b>Team ID</b>       | [SWTID-2026-9584]                                                                 |
| <b>Project Name</b>  | Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer |
| <b>Maximum Marks</b> | 2 Marks                                                                           |

**Proposed Solution Template:**

The project team's proposed solution is summarized below:

| S.No. | Parameter                                           | Description                                                                                                                                                                                                                                                                             |
|-------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.    | <b>Problem Statement<br/>(Problem to be solved)</b> | IT procurement lacks an automated way to generate and assign hardware configuration tasks for standard laptop orders, causing delays, manual overhead, and inconsistent turnaround for both employees and the IT team.                                                                  |
| 2.    | <b>Idea / Solution description</b>                  | A ServiceNow Flow Designer automation that, the moment a Standard Laptop Request is approved, automatically creates and assigns a hardware configuration task to the Hardware team, updates the request status at each stage, and notifies the requester and Hardware team accordingly. |
| 3.    | <b>Novelty / Uniqueness</b>                         | Uses ServiceNow's native, no-code Flow Designer to remove a purely manual handoff step, with built-in SLA escalation and automatic asset registration in the CMDB — no custom scripting or external integration required.                                                               |
| 4.    | <b>Social Impact / Customer Satisfaction</b>        | Reduces new-employee onboarding delays and IT team workload, improving first-day productivity and employee satisfaction with IT services, while freeing the procurement team from manual follow-up.                                                                                     |
| 5.    | <b>Business Model (Revenue Model)</b>               | This is an internal IT efficiency solution rather than a revenue-generating product. Value is realized through cost-avoidance: fewer manual hours on request handoffs, faster laptop turnaround, and lower risk of missed or delayed configurations.                                    |
| 6.    | <b>Scalability of the Solution</b>                  | Built using reusable Flow Designer subflows and standard ServiceNow tables, the same pattern can be extended to other standard hardware/software requests (monitors, licenses, mobile devices) and scaled across departments or locations with minimal rework.                          |
